# The Status of Health Infrastructure in Punjab: A Study of Post-Reform Period

## Avinash Kaur\* and Rajinder Kaur\*\*

- \* Dept. of Commerce, Punjabi University Patiala, Punjab
- \*\* Dept. of Commerce, Punjabi University Patiala, Punjab

#### **Abstract**

Health is considered as a critical human capital component, which contributes significantly to the growth and development of a country. Health is an important factor in the socioe-conomic production function. Thus, the aim of the paper is to study the status of health infrastructure in Punjab for the post-reform period i.e. from 1991 to 2014. The various indicators of health infrastructure undertaken for the purpose of the study are medical institutions by location and ownership, medical institutions by type of institutions, number of ayurvedic, homeopathic & unani insitutions and number of registered medical & para -medical personnel. The study found that the number of medical institutions and number of beds in medical institutions decreased during the study period. The study further revealed that the number of registered medical and para-medical personnel have shownan upward trend. The study concluded that government should invest more in health infrastructure and encourage the private sector to invest in the health infrastructure by promoting Public-Private Partnership (PPP).

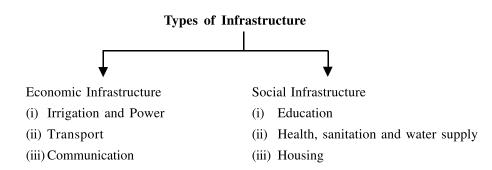

## **Key Words**

Health, Health infrastructure, Punjab, Medical Institutions.

# INTRODUCTION

Infrastructure is a basic physical and organizational structure required for the operation of a society or enterprise, or the services and facilities necessary for an economy to function. It can be generally defined as the set of inter-connected structure elements that provide the framework supporting an entire structure of development. It is an important term for judging a country or region's development. The word is a combination of two Latin words infra meaning "beneath" and structural meaning "to construct." Infrastructure is an umbrella term for several activities. These include public works like railways, roads; major irrigation works etc. and also public utilities like power, telecommunication, tap water supply, sanitation and sewerage etc. The infrastructure term also includes facilities pertaining to health, education, skill formation, etc. These activities are necessary for the working of an economy. Infrastructure is categorized into two types: Economic Infrastructure and Social Infrastructure.

- Economic Infrastructure is defined as the infrastructure that helps in promoting economic activities such as roads, highways, railroads, airports, seaports, electricity, telecommunications, water supply and sanitation.
- Social Infrastructure (such as schools, libraries, universities, clinics, hospitals, courts, museums, theatres, parks, fountains and statues) is defined as the infrastructure that helps in promoting the health, education and cultural standards of the population activities that have both direct and indirect impacts on the welfare.

The present paper focuses on the health infrastructure of Punjab.Health infrastructure is a significant indicator for understanding the healthcare policy and welfare mechanism in a nation. It indicates the investment priority with regard to the creation of healthcare facilities. The health of nation is an essential component of economic growth and development. As it is rightly said "Health is Wealth". The health of the people is treated as a direct measure of a country's energy and efficiency to achieve growth at a faster rate. Health is considered to be an important factor in the socio-economic production function. As an able-bodied and healthy worker is a more productive worker. Good health is not only the means, but also end of development. Thus, health infrastructure is an investment for human capital formation.

# **REVIEW OF LITERATURE**

In this section, an attempt is made to review the studies dealing with the health infrastructure.

Purohit and Tasleem (1994), analyzed the utilization of health services in India from various angles. It was found that the level of utilization was higher in states with higher per capita Governmental expenditure on healthcare, while the states with lower per capita governmental expenditure depicted lower levels of utilization. Banerjee and Esther (2004) examined the delivery of healthcare and the impact it had on the poor population based on a survey conducted in rural Udaipur. The study observed that villagers' health was poor despite the fact that they heavily used healthcare facilities and spent a lot on healthcare. Joshi (2006) analysed the expenditures incurred by the Central and State Governments on social sector during the pre-reform period and post-reform period. The study found that there had been a rise in health expenditure from 0.8% of GDP in 1980-81 to 0.92% in 1989-90 (i.e during pre-reform period). William, Mishra and Navaneetham (2008) made an attempt to study health inequality in India by utilizing National Family Health Survey-3 data. The study found that the degree of health inequalities escalated when the rising average income levels of the population were accompanied by rising income inequalities. Kumar and Gupta (2012) made an attempt to study health infrastructure in India and the impact of National Rural Health Mission (NRHM) initiated by the central government. The study found that government is required to take an integrated approach, which must take into consideration meeting the regional differences.

## **OBJECTIVE OF THE STUDY**

To analyze the trends in health infrastructure in Punjab during post-reform period i.e from 1991-2014.

## DATABASE AND METHODOLOGY

The present is based on secondary data. The data on different variables used in the study are taken from various issues of Statistical Abstract of Punjab, for the period of 24 years i.e from 1991-2014. For comparative analysis the period has been divided into two sections:

- (i) First period from 1991-2000
- (ii) Second period 2001-2014

The variables undertaken for the purpose of study are:

(i) Public medical institutions according to location.

- (ii) Public medical institutions according to type of institutions
- (iii) Number of ayurvedic, homeopathic and unani institutions
- (iv) Number of beds by area and type of medical institutions
- (v) Number of registered medical and para-medical personnel.

For analyzing the data, the Compound Annual Growth Rate (CAGR), averages, standard deviation and coefficient of variation have been used. Moreover, graphs are also used.

# **Growth of Public Medical Institutions by Location**

Table 1 presented the public medical institutions according to location. Pubic medical institutions are those which are owned by state government, local government and voluntary organisations and includes hospitals, Primary Health Centres (PHCs), Dispensaries and Community Health Centres (CHCs). The Table reveals that the growth in the number of medical institutions in rural and urban areas. It is observed that during the first period (1991-2000) the number of medical institutions increased from 2204 to 2229 (showing a growth rate of 0.11% per annum). However, during the second period, i.e. from 2001-2014, the number of medical institutions declined from 2229 to 1979 revealing negative growth rate of -1.36%. During 1991-2014, the total number of medical institutions decreased from 2204 to 1979; depicting a negative growth rate of -0.57% per annum. The number of medical institutions during 1991-2014, rose from 2204 to 2242 till 2005, but afterwards it shows a decreasing trend, the number of medical institutions, declining to 1979 in 2014 (portraying a negative growth of -0.16% per annum. Thus, it is observed that the maximum growth in the number of medical institutions has been recorded during the first period.

The number of medical institutions declined in both rural and urban areas. During 1991-2014, the number of medical institutions in rural areas, decreased from 1799 to 1692 (showing a negative growth rate of -0.26% per annum) and number of medical institutions in urban areas also declined from 405 to 287 (showing a negative growth of -2.15 per annum). It is further observed that during the first period, the growth in the number of medical institutions in urban areas is greater as compared to rural areas, showing a growth rate of 1.08% whereas the medical institutions in rural areas depict a negative growth of -0.12%. During the second period (2001-2014), the number of medical institutions declined in urban and rural areas, at the negative growth rate of -0.51% and -5.41% respectively.

Thus, the number of medical institutions located in urban areas has witnessed remarkable growth during the first period only, but medical institutions in rural areas have registered negative growth during theperiod from 1991-2014. The mean value during 1991-2014 of total public medical institutions was 2160.54 registering a variation of 5.55%. The mean value during the same period in rural and urban areas was 1755.04 and 405.5 with a variation of 2.20% and 20.52% respectively. Figure 1 shows the number of public medical institutions.

# **Growth of Different Types of Public Medical Institutions**

The classification of public medical institutions by type (hospitals, dispensaries, PHCs and others) has been presented in table 2. During the first period (1991-2000), rural areas witnessed a decline in the number of all types of medical institutions, i.e. in hospitals, PHCs and Dispensaries depicting negative growth rates i.e -1.47% per annum, -0.020% per annum and -0.21% per annum respectively. However the total number of medical institutions also declined, showing a growth rate of -0.12% per annum, whereas the number of other medical institutions showed a growth rate of 2.94%. The urban areas, on the other hand, witnessed an increase in all types of medical institutions, i.e. hospitals, PHCs, dispensaries, others and total of all these types revealing growth rates of 0.52%, 1.11%, 0.92%, 4.28% and 1.06% per annum respectively. The highest growth rate is recorded in other type of medical institutions. During the second period (2001-2014), in rural areas all types of institutions portrayed negative growth rates viz. hospitals, PHCs

and dispensaries of -27.87%, 0.094% and -0.29% per annum respectively, while other type of medical institutions presented growth of 2.93% per annum. Even, during the total period (1991-2014) in case of rural areas the negative growth rates are displayed in hospitals by -13.46%, PHCs by -0.116% and dispensaries by -0.17% per annum. The growth of other medical institutions was 1.94% during the same period. The urban areas during the same period, also witnessed negative growth in number of hospitals (-7.95%), PHCs (-3.97%), dispensaries (-6.57%) and in total number of medical institutions (-5.41%), however the type of medical institutions depicted growth of 3.45% per annnum. On comparing rural and urban medical institutions it is observed that more decline is in urban medical institutions showing negative growth of -2.15% per annum. The mean value of rural public medical institutions was 1755.04 with a variation of 2.20% and of urban public medical institutions was 405.62 with a variation of 20.53%. Under the rural category, the mean value of hospitals, dispensaries, PHCs and others was 57.92, 416.62, 1212.04 and 68.46 with a variation of 51.29%, 1.91%, 1.41% and 16.41% respectively. Whereas under urban category, the mean value of hospitals, dispensaries, PHCs and others was 119.96, 21.92, 217.71 and 45.95 with a variation 18.04%, 24.23%, 16.58% and 20.53% respectively.

# Growth of Ayurvedic, Homeopathic and Unani Institutions

Table 3 presented the number of ayurvedic, homeopathic and unani institutions in Punjab. It shows that during 1991 to 2014 the total number of ayurvedic, homeopathic and unani institutions has increased from 634 to 640 registering a growth rate of 0.032% per annum. During this period, maximum growth has been observed in homeopathic institutions (depicting a growth rate of 0.19% per annum) while ayurvedic and unani institutions showed negative growth rates of -0.0034% per annum and -0.029% per annum respectively. During the first period, the ayurvedic institutions registered a growth rate of 0.0037% per annum, while the homeopathic institutions have not shown any growth in the number of homeopathic institutions being 106 throughout this period and the number of unani institutions declined registering a negative growth rate of -0.16% per annum. During the second period (2001-2014), the number of ayurvedic and unani institutions remain constant 495 and 34, thus does not show any growth. Whereas the number of homeopathic institutions increased from 106 to 111 registering a growth rate of 0.37% per annum. However, during the total period (1991-2014), the number of ayurvedic and unani institutions registered a negative growth rate of -0.0034% and 0.029 per annum respectively, while the number of homeopathic institutions presented growth of 0.19\% per annum. Thus, it is observed that the maximum growth in homeopathic

# Number of Beds in Medical Institutions by Area and Type

Table 4 depicts the number of beds in various types of medical institutions and according to area for the period 1991-2014. The total number of beds in medical institutions declined from 24179 to 21962 showing a negative growth rate of -0.71% per annum. The number of beds according to area have moved down showing negative growth of -0.18% per annum in rural areas and -1.16% per annum in urban areas. During the first period, in rural areas the number of beds witnessed negative growth of -0.006% per annum. On the other hand, in urban areas growth was 0.74% per annum. Whereas during the second period number of beds revealed growth of -0.38% per annumand -2.97 in rural and urban areas respectively. During the first period, the growth rate of the number of hospitals, PHC, dispensaries and other medical institutions was 0.087%, -0.38%, -0.09% and 3.36 per annum. However, during the second period the growth of hospitals, PHCs, dispensaries and other medical institutions was -5.36%, 5.73%, -0.47% and 2.81%. During the total period (1991-2014), the number of hospitals showed a negative growth of -2.24% p.a., PHCs showed growth rate of 2.32% per annum dispensaries -0.16 per annum and others 1.27% per annum.

# Number of Registered Medical and Para-medical Personnel

Table 5 presented the number of registered medical and para-medical personnel. The Table also presented the population served per medical and paramedical personnel. During 1991-2014, the data highlights the number of doctors increased from 13237 to 25254, number of midwives enhanced from 12581 to 42989 and number of nurses swelled from 7647 to 59489. During the first period, maximum growth is observed in the number of midwifes (1.96 times) followed by number of nurses (1.85 times) and doctors (1.25 times). During the second period, maximum increase in number of nurses (3.82 times), followed by number of midwives (1.72 times) and doctors (1.51 times). However, during the total period, again number of nurses witnessed highest increase (7.77 times) followed number of midwives (3.42 times) and number of doctors (1.91 times).

Source: Statistical Abstract of Punjab, Various Issues.

Figures in parenthesis indicate population served per medical and para-medical personnel in Punjab.

It is observed that during the period 1991-2014, population served per doctor declined from 1514 to 1124, per midwife slipped down from 1538 to 662 and per nurse dropped from 2600 to 482. Thus, it is specified that the number of registered medical and para-medical personnel is showing increasing trend, whereas population served per registered medical and para-medical personnel shows decreasing trend. The mean value of number of doctors, midwives and nurses was 18607.38, 25985.21 and 24906.42 respectively with a variation of 20.69%, 28.79% and 65.57% respectively. During 1991-2014, the growth rate of number of doctors, midwives and nurses was 2.89% per annum, 4.25% per annum and 9.51% per annum respectively.

## **CONCLUSION**

Health is an important factor in the socio-economic production function. Health infrastructure is a significant indicator for understanding the healthcare policy and welfare mechanism of a nation. The heath of nation is a significant component of economic growth and development. The study found that the number of public medial institutions have reduced over a period of time. The number of medical institutions in rural areas have shown decreasing trend depicting negative in the period (1991-2014) undertaken for study. The medical institutions in urban areas, however, showed upward trend in the first period but decreased in second period. The number of hospitals, dispensaries and Primary Health Centres (PHCs) declined in rural areas during this period. However, the number of other medical institutions showed upward trend and revealed growth in both the time periods. On the other hand, the number of hospitals, dispensaries and PHCs in urban areas also decreased in the second period but showed growth in the first period. The other medical institutions (comprising hospital / Community Health Centres or Primary Health Centres / Community Health Centres) in urban areas showed upward trend. The ayurvedic and unani institutions did not show growth and the homeopathic institutions increased during this period. The total number of beds in medical institution has declined. The number of beds has shown decreasing trend area wise also. The number of beds in urban areas has depicted more decline as compared to number of beds in rural areas. The number of beds in hospitals and dispensaries has gone down, while the number of beds in PHCs and other medical institutions has risen. The number of registered medical and para-medical personnel has shown upward trend. The number of doctors, midwives and nurses increased during this period. The study depicts that the situation is not good and not upto mark in Punjab. The public sector is not rendering better services as desired by people. It is, therefore, required on the part of the Government to invest more funds in health sector and to encourage private sector by promoting Public-Private Partnerships (PPP).
